

# Array

## Data Structure

23	32	43	90
0	1	2	3

An Array Is a Collection Of Items  
Stored In a Continuous Memory  
Location, Typically of a same type

arrayOfFruits

0

1

2

3

The Idea Is To Store Multiple  
Items Of Same Type Together

## Array Of Fruits

Name of variable

arrayOfFruits[2] =  .....> Element

An Array Contains Data Elements Of The Same Type Stored One After Another In Memory And Each Element Is Assigned A Index Value And Array Index Is Always Starts With 0 Index Can Be Used To Access Single Element From Array

`arrayOfFruits[3] =`  

Let's Understand It By An Example Suppose Here We Have A Array Of Fruits It's Of Same Type Of Fruits Now Suppose You Want The Banana Then You Can Use Index 3 To Get It

# Types Of Array

1D Array

3	2
---	---

2D Array

1	0	1
3	4	1

3D Array

1	7	9
5	9	3
7	9	9

## ONE Dimensional ARRAY

A One-Dimensional Array Is a Type Of Linear Array in which the elements are stored linearly

23	32	43	90
0	1	2	3

You can access each element individually by specifying the index value

## MULTI Dimensional ARRAY

A Multi-Dimensional Array includes 2D And 3D Arrays. The 2D array is organized as matrices

	0	1	2	3
0	0	1	2	3
1	4	5	6	7
2	8	9	10	11

## OPERATIONS YOU CAN PERFORM ON ARRAY

TRAVERSING

INSERTION

DELETION
